Bed Layout Grid

A friendly getting-started guide

This sheet is your garden's map. Before you plant a single seed, sketch where everything will go so your tomatoes don't shade out your lettuce and your zucchini doesn't swallow the whole bed.

How to use it

1. **Measure your bed** and write its real width and length in the boxes at the top.
2. **Count the grid squares** so each square equals a set size — for a 4×8 foot bed, each square can stand for 6 inches.
3. **Draw your plants** in the squares. Tall crops (corn, pole beans, trellised peas) go on the north edge so they don't cast shade on everything else.
4. **Leave walking room.** If you can't reach the middle from the edge, the bed is too wide or you need a path.

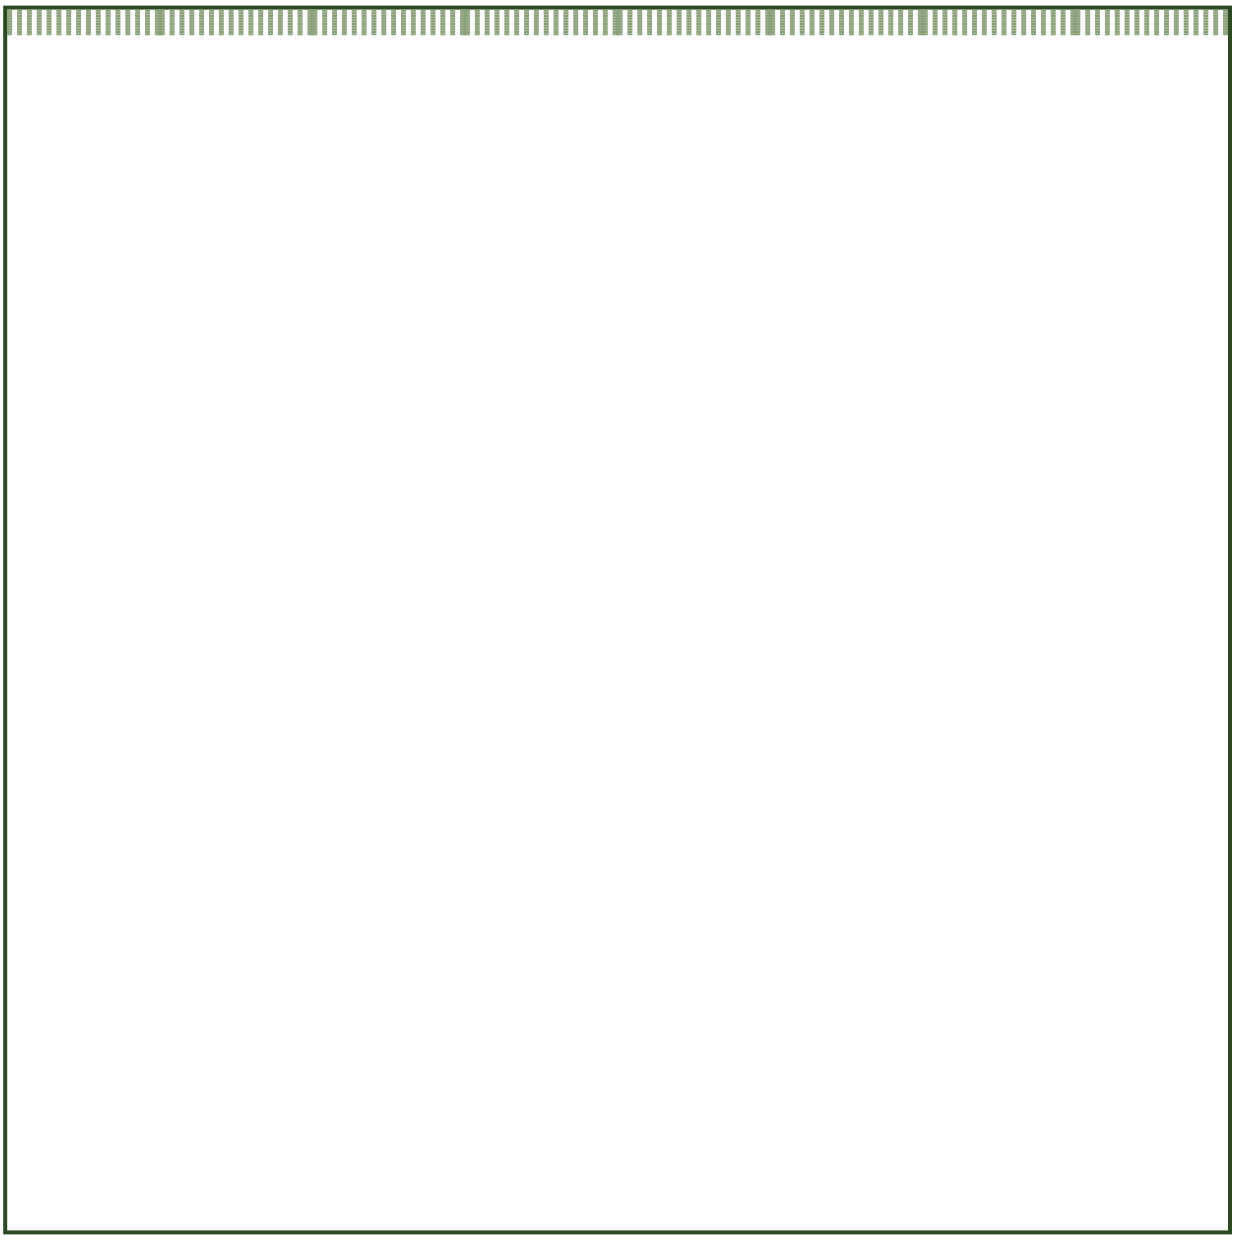
Beginner tip: Squash, melons, and cucumbers sprawl. Give them two or three squares each, even though the seed packet looks tiny. You'll thank yourself in July.

Companions to try: tomatoes + basil, carrots + onions, beans + corn. Avoid planting tomatoes where you grew potatoes last year.

Bed Layout Grid

Bed name: _____ **Width:** _____ **Length:** _____

Each grid square = _____ **Sun this bed gets:** _____ **Season / year:** _____



Mark the north edge with an N so tall crops end up in the right spot.
